

HAVIS

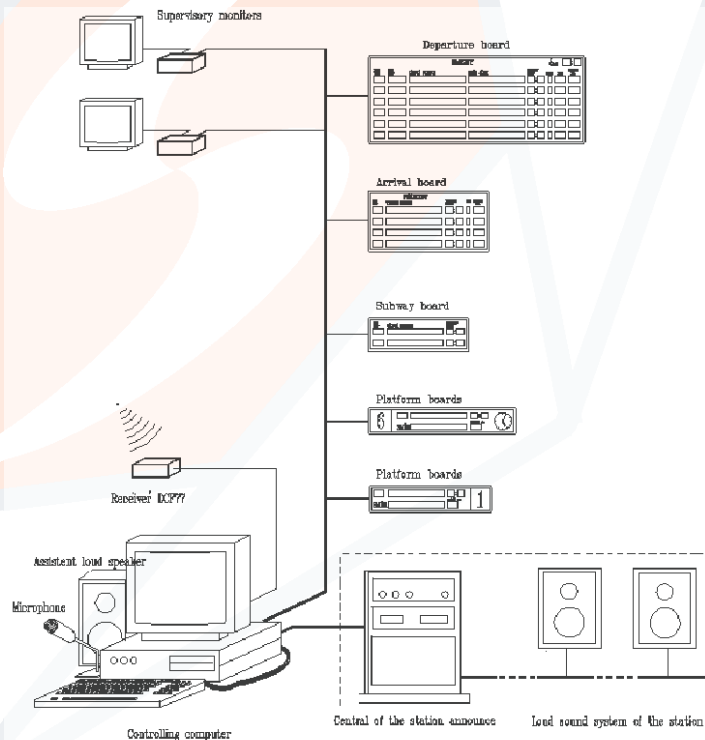

VOICE AND VISUAL INFORMATION SYSTEM

The voice and visual information systems determined to inform the train, bus or air line passengers in a visual and sound form. Both systems may work together as well as separately. The Visual Information System (VIS) consists of boards made up of active displaying elements -LED diodes (only red or three-coloured - red, green and orange) which are suitable to interiors or made up of electromagnetic bistable elements -boards for exteriors. Every symbol in the information line is programmable, which enables any change of displayed text. Panel made up of LED diodes enable the display of a running text in a chosen line so to increase the information capacity (extraordinary information, emergency warnings, advertisements etc). The panels are produced in a form which does not require any maintenance.

Boards producer:
ELEN Ltd.

Mr. Schichman

The Voice Information System (HIS) consists of a software, which dispose of a large scale of voice segments, of a programme which generates different announcements and their modifications according to the situation, with the possibility of manual or automatic control. SW contains moduls which operate the boards of the VIS system including their co-operation. The system hardware ensure entry to the annunciator, including its control, and the listening-in of the passing announcements and the possibility of connecting the microphone so the operator can make announcements directly.
